
Black faced Dorper Rams

Posted by QSDorpersYASS - 2009/04/11 08:59

Excellent bloodlines great conformation

Ready to work-\$220

Excellent forager-does well on poor country.

sheds hairy coat so no shearing costs.

Naturally mulesed - no need to crutch and is not susceptible to flystrike.

They have a high level of disease resistance

Dorpers are known for their high twinning rate. Lambing rates of up to 225% (calculated on an annual basis) can be achieved. Dorpers have a high fecundity and are not season sensitive allowing three lambings in two years.

AN EXTREMELY LOW MAINTENANCE ANIMAL.

Dorpers thrive in arid to semi-tropical climates and are suitable for 100mm to 760mm rainfall areas. Excellent feed utilisation and conversion-live weight of about 36 kilograms can be reached at the age of 3.5 - 4 months under arid conditions. This ensures a high quality carcass of around 20 kilograms. Our own Dorpers, on natural pastures in mid winter, showed an average weight gain of 0.34kg/day. Some lambs are over 0.4kg/day.
